

Stylish heating with the „cool heat“ designer heaters.

Like simple heaters, they are integrated into the central heating system with a heating circuit of their own, or they are heated electrically. Ceramic radiant heat is the grandmother of all Infrared heaters. It feels as pleasant to the human organism as the natural warmth of the rays of the sun. Ceramic radiant heat is a stimulating effect of comforting warmth.

Puristic, sensual, warm – the bathroom as a place for relaxation emanates peace and comfort and is arranged with much eye to detail. Therefore, heat sources which create a relaxing atmosphere in this important room are becoming increasingly popular. The ceramic design objects of Sommerhuber combine aesthetics and healthy-living warmth.

A new addition to our catalogue are the puristic „pure art“ heating systems. Here, the company puts sophisticated technology into a staggeringly clear design. With its ceramic healthy warmth, they emanate a pleasant atmosphere of comfort in any rooms. The mild ceramic radiant heat, comes closest of all types of heating to the natural warmth of the sun. Contrary to customary metal heaters, „pure art“ does not heat the air in the room, but it heats floor, walls, and ceiling with longwave Infrared rays. This

prevents the constant circulation of the air with dust and bacteria. Thus, the soft ceramic radiant heat lends the room a balanced climate which protects the mucous membranes and the airways.

The glazes of the heating objects are offered in many contemporary colours and surfaces, and the large selection of accessories complements the heating function. The heating systems can be equipped with different clever lighting solutions.

A pleasant atmosphere is created with this indirect lighting, and the objects become impressive sculptures. The combination of glass and ceramics of the classic column allows it to become an intelligent bathroom partition which visually separates the toilet from the remainder of the room. Equipped with a towel rail, an elegant wall of radiance becomes a stylish butler.

Assembling the designer heaters is especially easy and fast: Like customary heaters, they are integrated into the central heating with a heating circuit of their own, or individually heated electrically, or in a brand-new approach, operated with a combination of water and electricity. The system is so well thought-out that installation can take under two hours.
